Combined data and image sources: NASA, NOAA, NGA, ESA, CNSA

I. Summary

Based on common patterns that appear on exaggerated Earth relief model, also based on density reference from exaggerated Earth GEOID model.

Hypothesis event in the history of Earth is identified.

Icy object landed on and unified with earth. (code name: Project Earthypo)

I-I Conclusion, Pattern Identification

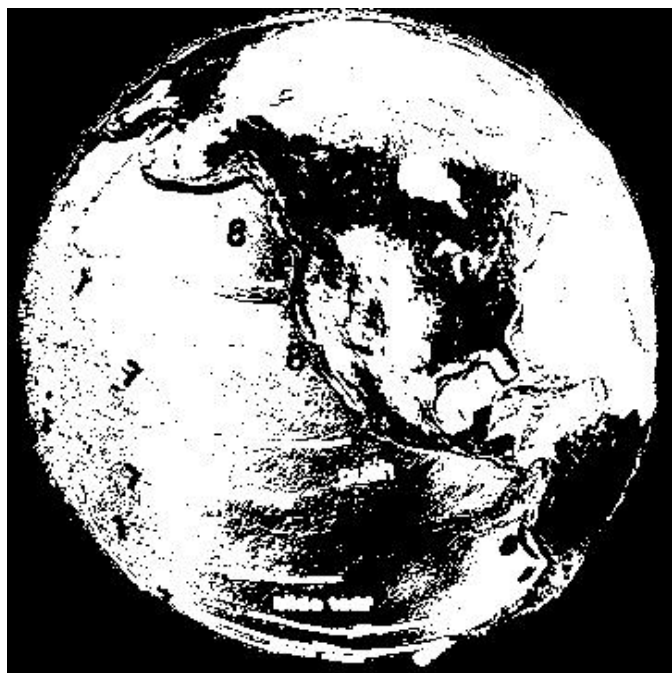

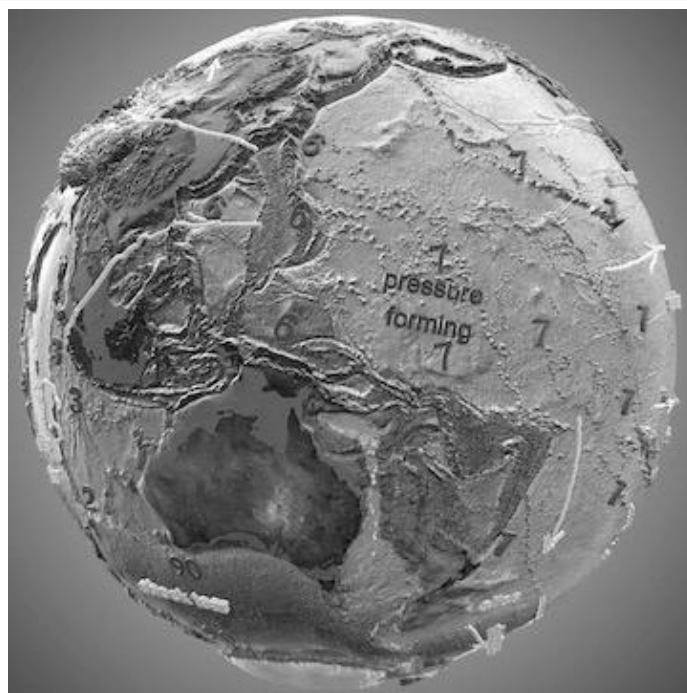

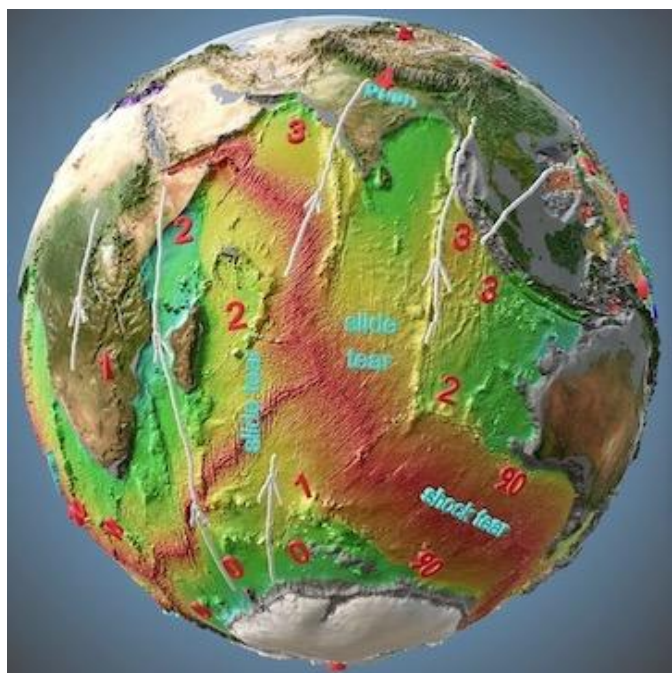

Patterns and motion tracks commonly appear in collision events show up on earth surface.

By introducing external object, such as lcy body, can explain the coincident patterns with close match.

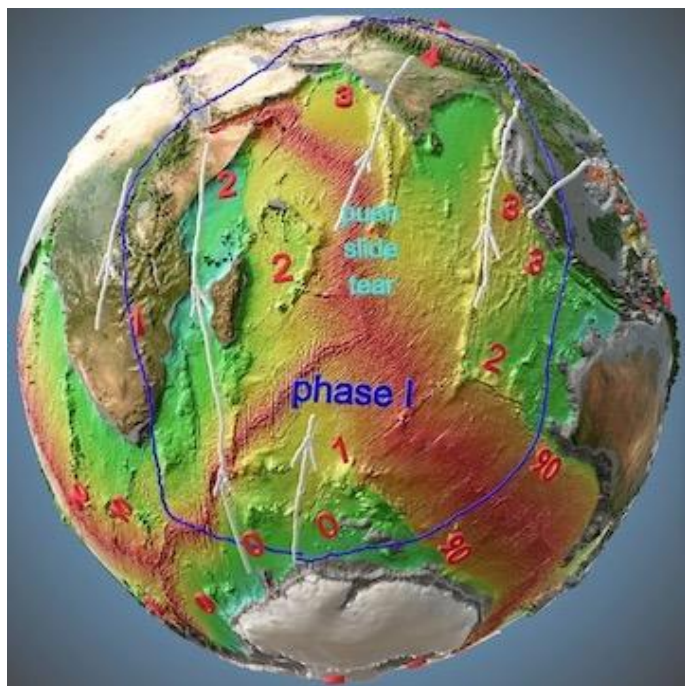

Initially, lcy body has hard solid physical properties, can create many ice shock events, but not to earth-shattering extent.

After melting, leave no apparent trace of occurrence.

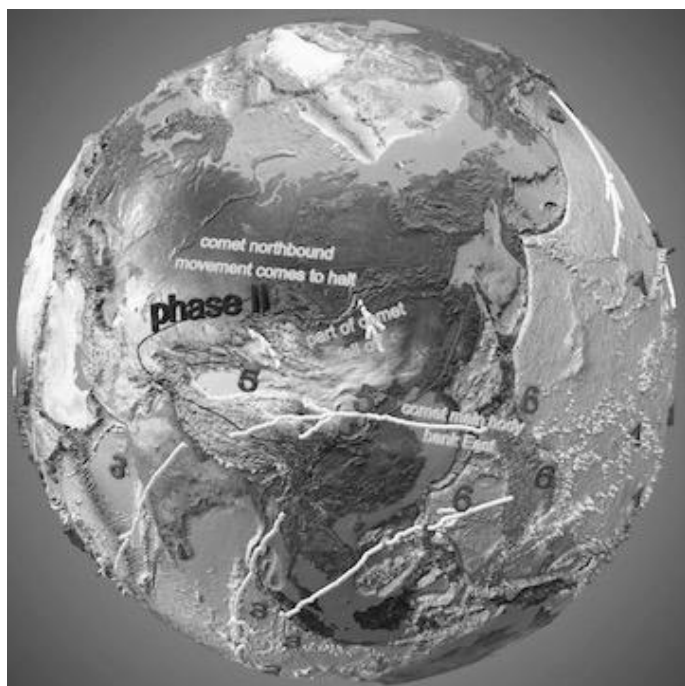

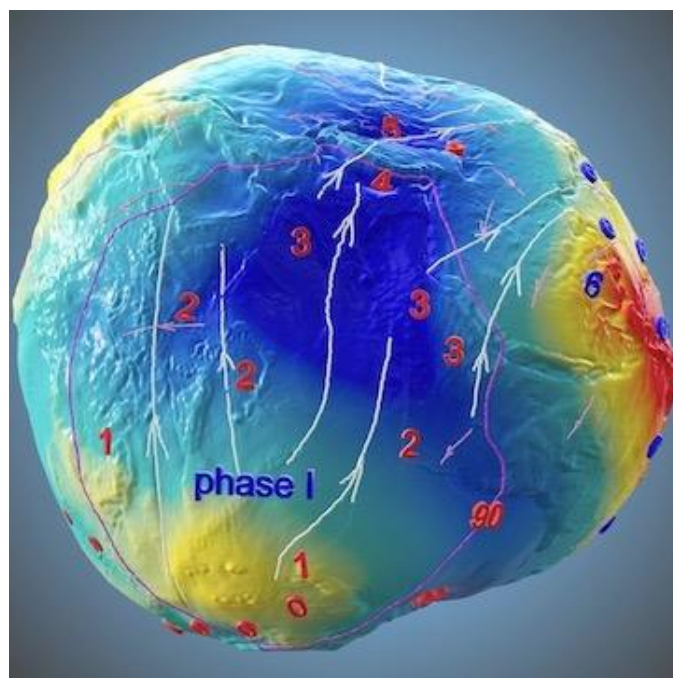

Large amount of water on earth surface also can be considered as indirect evidence.

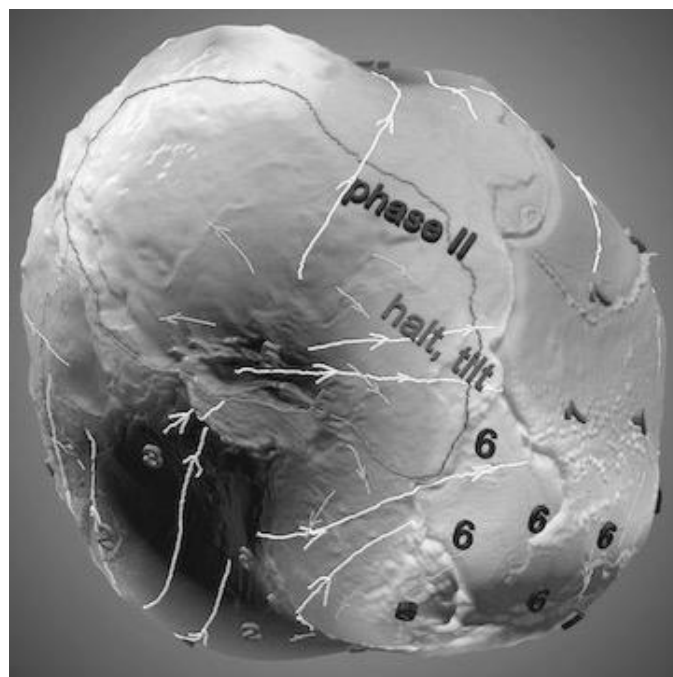

I-II Conclusion, Event Sequence Phase Classification

Phase I, initial slide in

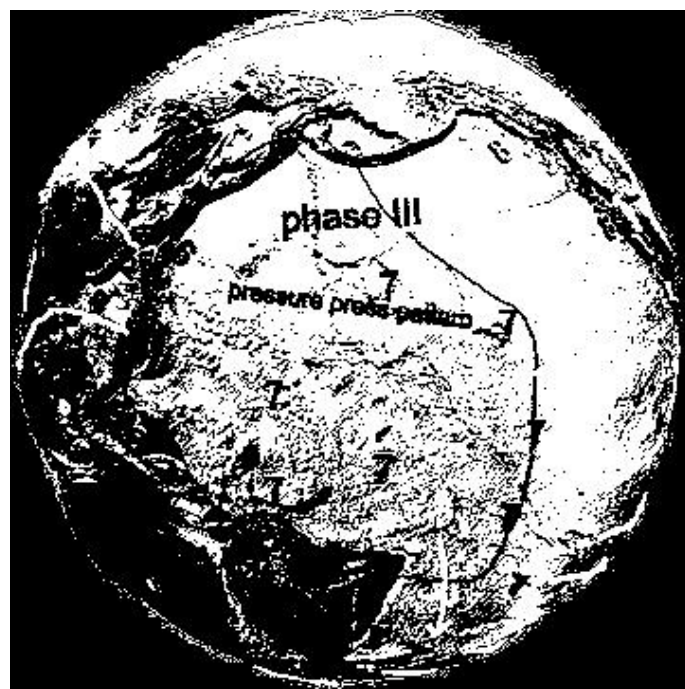

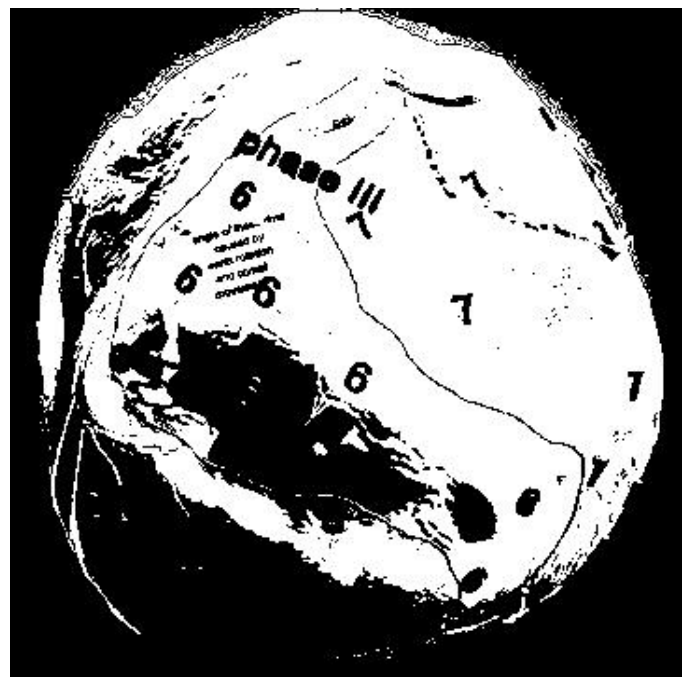

Phase II, northbound movement halt and turning

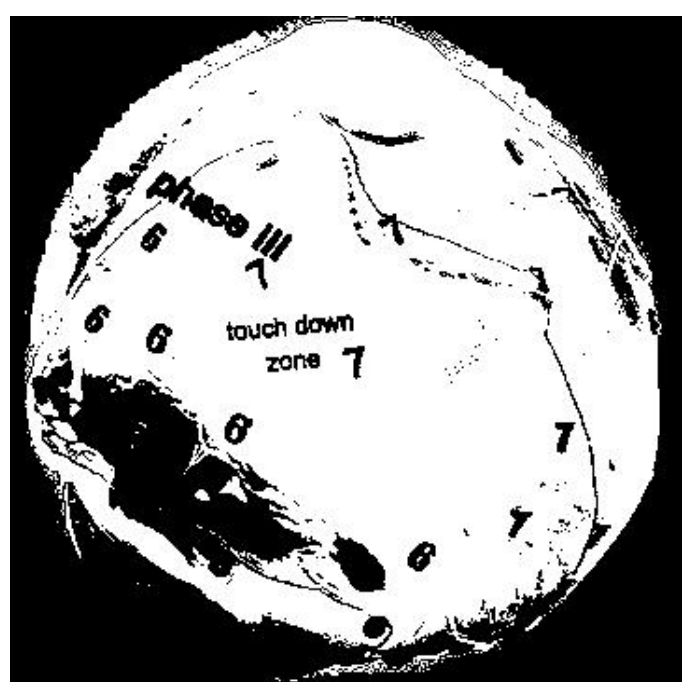

Phase III-1, pivot contact regions

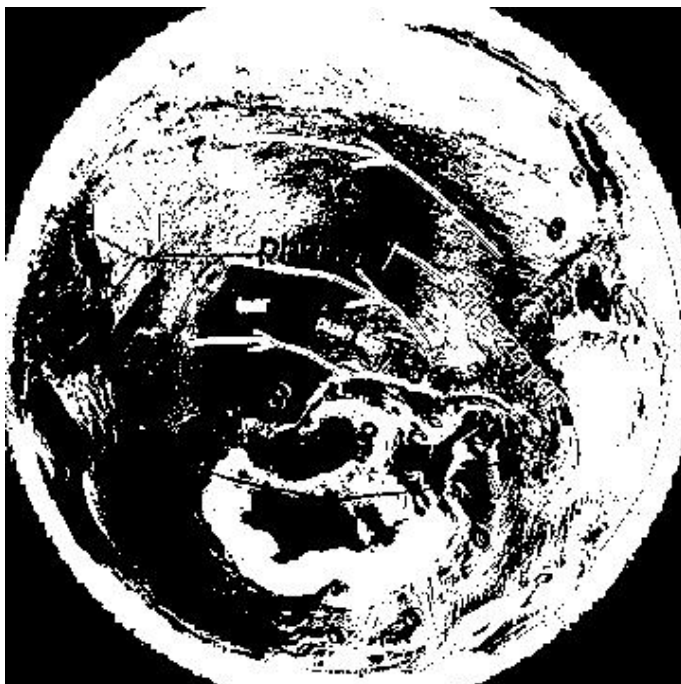

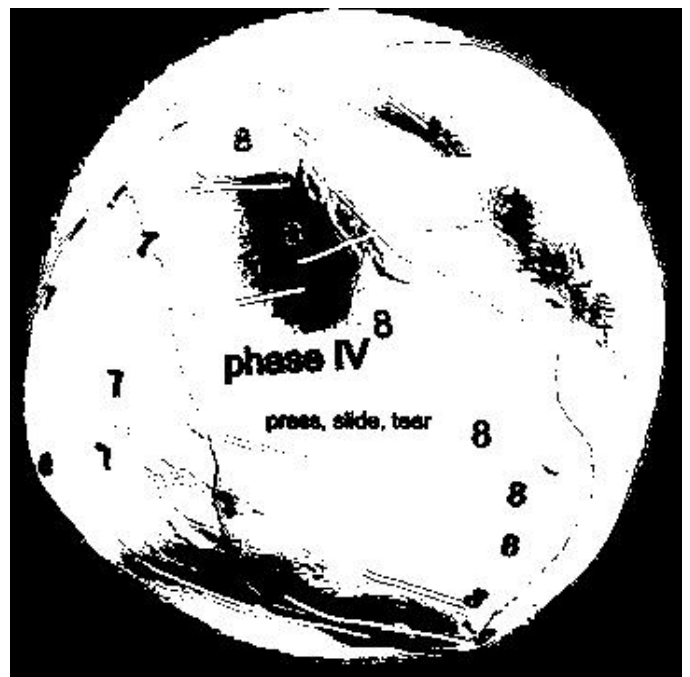

Phase III-2, touchdown region, pressure forming

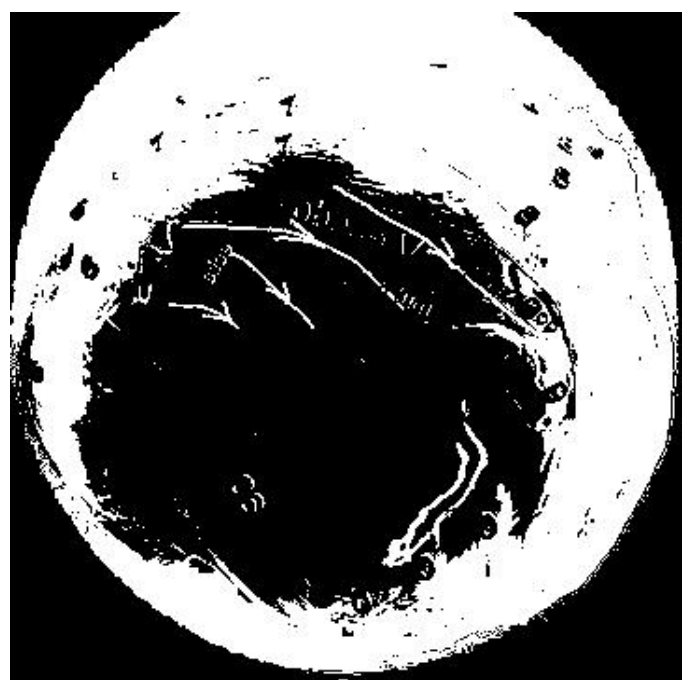

Phase IV, shovelling motion

Phase V, slice, tear, push turn, squeeze and pop

Together, We Shall Make History
